SAECOIN

TESTNET ANNOUNCEMENT

Project: SAECOIN
Ticker: SAC (Provisional)
Document: Testnet_Announcement.md
Version: 1.0
Status: Draft — Not Yet Published
Date: October 2026

---

1. Introduction

The SAECOIN project is preparing to develop and test an independent Layer-1 Proof of Work blockchain.

The proposed network is designed around:

- Proof of Work consensus.
- UTXO-based transactions.
- Independent full nodes.
- CPU and GPU mining objectives.
- Secure wallet applications.
- Transparent blockchain verification.

Before any mainnet launch, SAECOIN intends to conduct a structured testnet program.

This announcement document will be updated when the testnet is ready for public participation.

2. What Is SAECOIN Testnet?

SAECOIN Testnet will be a separate blockchain network used for development, testing, and experimentation.

It will allow developers and testers to evaluate network functionality without using mainnet cryptocurrency.

Testnet coins are intended only for testing.

They will have no guaranteed monetary value and should not be treated as an investment or payment asset.

3. Testnet Objectives

The testnet program aims to evaluate:

1. Block production.
2. Proof of Work validation.
3. Transaction processing.
4. UTXO management.
5. Full-node synchronization.
6. Peer-to-peer networking.
7. CPU mining.
8. GPU mining.
9. Wallet creation and recovery.
10. Network stability.
11. Difficulty adjustment.
12. Blockchain reorganization behavior.
13. Security and attack resistance.
14. Explorer functionality.

4. Who Can Participate?

Depending on the testnet phase, participation may be open to:

- Blockchain developers.
- CPU miners.
- GPU miners.
- Full-node operators.
- Wallet testers.
- Security researchers.
- Technical contributors.
- Community members.

Participation requirements will be published before each testing phase.

5. Testnet Features

The planned testnet may include the following components:

Component| Purpose
Full Node| Blockchain validation and synchronization
CPU Miner| CPU-based Proof of Work testing
GPU Miner| GPU mining evaluation
Android Wallet| Mobile wallet testing
Windows Wallet| Desktop wallet testing
Block Explorer| Public blockchain inspection
Network Monitor| Network health monitoring

Features will only be announced as available after they have been implemented and verified.

6. Testnet Coins

Testnet coins are experimental network units.

They:

- Are not mainnet SAC.
- Have no guaranteed market value.
- Are not guaranteed to be exchangeable.
- May be reset or deleted.
- May become inaccessible after a network reset.
- Must not be purchased as an investment.

The project does not promise that testnet balances will convert into mainnet balances.

7. Testnet Network Parameters

Final network parameters will be published before launch.

The following values are currently proposed design targets, not finalized testnet settings:

Parameter| Current Proposal
Project| SAECOIN
Ticker| SAC (Provisional)
Consensus| Proof of Work
Transaction Model| UTXO
Target Block Time| 10 Minutes
Initial Subsidy| 50 SAC
Halving Interval| 210,000 Blocks
Maximum Supply Target| 21,000,000 SAC
Premine| 0 SAC

The testnet may use separate experimental parameters.

8. Testnet Participation Requirements

Participants may need:

- A supported computer.
- Windows, Linux, or another officially supported operating system.
- Sufficient storage space.
- Stable internet connectivity.
- Testnet node software.
- Testnet wallet software where applicable.

Exact hardware requirements will be published after benchmarking.

The current development environment targets Windows 11 with 16 GB RAM.

This does not mean the same hardware requirements will apply to every node or mining configuration.

9. Mining Participation

Testnet miners may help evaluate:

- CPU mining performance.
- GPU mining performance.
- Block propagation.
- Difficulty adjustment.
- Mining stability.
- Hash-rate distribution.
- Power consumption.

Mining software and supported algorithms will be announced only after implementation and testing.

No mining income or future mainnet reward is guaranteed.

10. Wallet Testing

Testnet wallet testers may be asked to evaluate:

- Wallet creation.
- Address generation.
- Sending transactions.
- Receiving transactions.
- Transaction confirmation.
- Backup.
- Recovery.
- Password protection.
- Error handling.

Participants must never use mainnet private keys or recovery phrases in testnet software.

11. Reporting Bugs

Participants should report technical issues with sufficient information for investigation.

A bug report should include:

- Software version.
- Operating system.
- Affected component.
- Description of the issue.
- Steps to reproduce.
- Expected behavior.

- Actual behavior.
- Relevant logs with sensitive information removed.

Private keys, seed phrases, passwords, and wallet backup files must never be included in bug reports.

Security vulnerabilities should be reported through the project's designated private security channel once established.

12. Testnet Resets

The testnet may be reset during development.

A reset may:

- Replace the genesis block.
- Remove existing blocks.
- Clear testnet balances.
- Change network parameters.
- Require software upgrades.
- Invalidate previous testnet wallets.

Participants should not rely on testnet data as permanent storage.

13. Security and Responsible Testing

Participants must not:

- Attack systems they do not own or have permission to test.
- Attempt unauthorized access.
- Disrupt unrelated infrastructure.
- Publish private information.
- Upload malicious software.
- Impersonate project maintainers.

Security testing should be performed only within authorized environments.

14. Testnet Phases

The proposed testnet program consists of several stages.

Phase 1 — Private Testnet

Purpose:

- Initial network validation.
- Block and transaction testing.
- Basic node synchronization.

- Consensus debugging.

Phase 2 — Developer Testnet

Purpose:

- Developer integration.
- Wallet testing.
- Mining testing.
- API and explorer testing.

Phase 3 — Public Testnet

Purpose:

- Broader participation.
- Network stress testing.
- Mining distribution evaluation.
- Security testing.
- Operational monitoring.

Phase 4 — Final Testnet Evaluation

Purpose:

- Final protocol validation.
- Regression testing.
- Upgrade testing.
- Mainnet readiness assessment.

Progression between phases will depend on test results, not predetermined dates.

15. Testnet Schedule

The public testnet launch date has not been established.

The project will publish dates only after:

- Core software is implemented.
- Basic consensus tests pass.
- Node synchronization works.
- Mining functionality is verified.
- Wallet safety requirements are met.
- Testnet infrastructure is prepared.

No launch date is promised by this draft.

16. Mainnet Relationship

Testnet participation does not guarantee:

- Mainnet coins.
- Airdrops.
- Mining rewards on mainnet.
- Financial benefits.
- Exchange listings.
- Special privileges.
- Future project allocation.

Mainnet rules will be defined separately.

17. Communication Channels

Official communication channels must be established before public announcement.

Official Website: [To Be Established]
GitHub Repository: [To Be Established]
Testnet Documentation: [To Be Established]
Community Channel: [To Be Established]
Support Contact: [To Be Established]
Security Contact: [To Be Established]

Participants should verify software downloads through official channels.

18. Important Disclaimer

SAECOIN Testnet is intended for experimental and development purposes.

Testnet software may contain bugs, incomplete functionality, and security weaknesses.

Testnet data may be reset or permanently deleted.

Participants should not use testnet software to protect real funds or conduct real-value transactions.

No financial return, token value, exchange listing, or mainnet conversion is promised.

19. Current Project Status

At the time of this document:

- SAECOIN is a proposed blockchain project.
- No public testnet launch is being claimed.
- No operational mainnet is being claimed.
- Final consensus parameters remain under review.
- Mining software is not being claimed as implemented.

- Wallet software is not being claimed as production-ready.
- Official communication channels have not been finalized.

This document is a preparation template and must be updated before public distribution.

20. Conclusion

The SAECOIN testnet program will be an important stage in evaluating the project's technical design.

Its purpose is to identify problems, test assumptions, improve security, and validate network behavior before any mainnet deployment.

The project will prioritize reliable engineering and transparent testing over an early launch.
